WORK EXPERIENCE

IT360° Full Stack Developer

05.2022 - 12.2023

After joining the company, I developed a custom theme for a dog training platform, improving the learning experience and overall quality of the site. I also developed modern, SEO-friendly websites and online stores for clients, handling new projects, maintenance and troubleshooting, including virus-infected sites. I worked on React applications, using NextJS and AI integrations.

Leocode Backend Developer

11.2022 - 05.2023

I handled API endpoints for a meditation and self-improvement mobile app, migrating subscriptions and adding livestreaming features. I also created a Node.js microservice for in-app chat and integrated it with the livestreaming service. Some of my tasks also included working with the frontend and theme customisation.

L7IT Full Stack Developer, Freelancer

07.2021 - now

After leaving my first job, I ventured into freelancing with a strong focus on user accessibility and website performance. I'm dedicated to delivering perfect websites and am always open to client input. I thrive on taking on challenging tasks and continually developing my skills. One of my notable projects involved creating a 3D product preview with dynamic logo editing for a client who had struggled with previous developers. They needed a WooCommerce plugin that would allow customers to upload raster and vector graphic files, customise a 3D bottle model and add the product to their shopping cart. I'm currently working on two exciting projects. The first is a Next.js application that allows clients to manage work across multiple teams and employees. They can add managers and teams, define scopes of work, create tasks and track progress with photo documentation. The second project involves the integration of three key data sources: warehouse and accounting management, the customer's bank account and CRM.

Expert4you Senior Web Developer

07.2021 - 06.2022

My debut on a large project involved maintaining and improving a 20 year old project, which included creating a WordPress website and integrating it with an old CRM system. A challenging task was to develop a WordPress-style course archive and enrolment system integrated with API from CRM endpoints.

Pressly Lead Developer

03.2021 - 09.2022

I was responsible for developing an online store using PrestaShop. My role was to manage the project and handle the backend functionality. In the late stages of the project I also finished the frontend templates and created some custom modules for the back office. After deployment, I helped with maintenance.

Ideamotive Full Stack Developer

11.2020 - 07.2021

My main goal was to finish a platform for driving schools. Users could search, rate, comment and contact schools and instructors. This project also included integration with maps and geodata, which was used to sort schools by distance.

Estima Group Web Developer

07.2019 - 08.2021

In this role, I worked on numerous landing pages and online stores, developing custom themes and plugins to meet client requirements. Notably, I seamlessly integrated a website with a React Native mobile app, simplifying content management through a WordPress admin panel.
